KOMTAS

DATA MESH READINESS ASSESSMENT

Data Mesh Advisory Services

Two services · Data Mesh Readiness Check, Data Mesh Readiness Assessment

1 **Why it matters**
Data mesh is an operating model, not a layer: it decides who runs the data an answer is built from. p. 2

2 **Two services**
Readiness Check and Readiness Assessment — what each covers, how long it takes. p. 3 – 5

3 **How it is run**
One method, four kinds of evidence, phases and team by service. p. 6

4 **What comes out and next steps**
Deliverables by service, the follow-on work, what is needed from your side. Appendix from p. 9. p. 7 – 8

Where It Sits — One Question, Four Layers

KOMTAS

An agent's answer is built from the layers below it. Data mesh adds no layer: it decides who runs the bottom one, and by which rules.

01 · WHY IT MATTERS

"Which customers bought from both business lines last quarter?"

"4,120 customers, from two domains' data products."
each with a named owner, a contract and a freshness commitment

THESE SERVICES

Action 360
Intelligent Work Experience

Where the question is asked and the answer lands: Teams, Slack, portal, API.

Agent 360
Governed Digital Workforce

Turns the question into a query and acts on the result.

Context 360
Enterprise Context

Says what "customer" means across domains: ontology, semantic layer, master data.

Data / Analytic 360
Trusted Data Foundation

Holds and serves the data. Data mesh moves its ownership to domains, on a common platform and common rules.

The answer travels back up — it is only as good as the bottom layer

WHERE A MESH WITHOUT ITS PREREQUISITES SHOWS UP IN THE ANSWER

Domain named, no owner

No one can say whose number the agent returned.

Ownership

A shared table called a product

No contract or SLA; no one can tell if it is current.

Data product

Rules removed, not federated

Two domains, two customer keys; the join fails.

Interoperability

Responsibility without capacity

The product is published, then left unmaintained.

Domain capacity

Two Services — Which One Fits

KOMTAS

Data Mesh Readiness Assessment. Each can be taken on its own; neither is a mandatory step before the other.

02 · TWO SERVICES

p. 4

A Data Mesh Readiness Check

Check the prerequisites · documents and interviews

Focus	Whether the domains in scope meet the five prerequisites
Scope	5 prerequisites, per domain in scope
Result	Gate status and an indicative result per domain
System access	None
Your team	3 · 4 · 5 days, S · M · L
Evidence	Statement · Document · Observation · Measurement
Weeks	S 1 · M 1.5 · L 2

p. 5

B Data Mesh Readiness Assessment

Readiness per domain · pilot and transition plan

Focus	Which domain can start, when, and what must close first
Scope	10 dimensions and 5 prerequisites, per domain
Result	Readiness matrix, pilot domain, transition plan
System access	None required
Your team	6 · 8 · 10 days, S · M · L
Evidence	Statement · Document · Observation · Measurement
Weeks	S 3 · M 3.5 · L 4

WHICH ONE FITS · THE QUESTION ON THE TABLE DECIDES

Is a quick view needed of whether the domains meet the prerequisites for data mesh? → A

Are a pilot domain, a start date and a transition plan needed before investing? → B

Both? A first: its evidence is reused in B and not billed twice.

A · Data Mesh Readiness Check

Check the prerequisites · documents and interviews.

KOMTAS

02 · TWO SERVICES · A

A

Data Mesh Readiness Check

Whether the domains in scope meet the five prerequisites

WEEKS S · M · L	YOUR TEAM days, S · M · L	SYSTEM ACCESS
1 · 1.5 · 2	3 · 4 · 5	None

WHAT IS CHECKED · 5 PREREQUISITES, PER DOMAIN

1. **Defined domain boundary**
   Which data belongs to the domain and how overlaps are settled — written or not
2. **Named data product owner**
   A person in the domain who can decide scope and acceptance, with a written assignment
3. **Domain engineering capacity**
   At least one dedicated person who can build and run the product; current workload
4. **Self-serve publishing path**
   Whether the domain can publish without opening a ticket with the central team
5. **Commitment to common rules**
   A written commitment to the federated governance standards
6. **Starting point**
   Existing data products, platforms and central team size — recorded as statements

HOW IT IS ASSESSED

Status per prerequisite, per domain

Met | Partly met | Not met

- **Met —** a document, a named person or a decision record shows it
- **Partly met —** exists, but incomplete or not yet in force
- **Not met —** missing; work cannot start on it

No evidence: “not assessed”, never met. No maturity score.

Per domain: ready to start · conditional · not ready

WHAT YOU GET

- Gate status for each domain in scope, with evidence
- Indicative result per domain, marked as statement-based
- Key risks and the recommended next step

No system access. Evidence comes from documents and interviews: org chart, role assignments, domain definitions, standards.

B · Data Mesh Readiness Assessment

KOMTAS

Readiness per domain · pilot and transition plan.

02 · TWO SERVICES · B

B

Data Mesh Readiness Assessment

Which domain can start, when, and what must close first

WEEKS S · M · L	YOUR TEAM days, S · M · L	SYSTEM ACCESS
3 · 3.5 · 4	6 · 8 · 10	None required

WHAT IS ASSESSED · 10 DIMENSIONS, PER DOMAIN

D1 Domain boundaries & ownership
Written boundaries, named owner, how overlaps are settled

D2 Data product definition & quality
Contract, SLA, versioning, quality commitment, acceptance

D3 Self-serve platform capability
Publishing without the central team: templates, automation

D4 Federated governance
Who sets common rules, how they are applied and monitored

D5 Interoperability & standards
Common definitions, keys, schema standard, joins across domains

D6 Domain engineering capacity
Dedicated people, skills, workload and continuity

D7 Discoverability & catalogue
Findability, metadata, lineage, access-request flow

D8 Consumer experience & SLA
Defined consumers, freshness and availability, support

D9 Central team role & transition
New role of the central team, hand-over order, stop condition

D10 Organisation, incentives & funding
Budget model, incentives, career path, sponsorship

Plus the prerequisite gate, per domain
Boundary · owner · capacity · publishing path · common rules. A prerequisite that is not met is not offset by high levels in other dimensions.

HOW IT IS ASSESSED

Current and target level, per domain

1	2	3	4	5
	current		target	

Five-level ladder, placed on evidence. No weighted score; the gate and the readiness matrix decide where to start.

WHAT YOU GET

- Domain readiness matrix with earliest start dates
- Pilot domain recommendation and its reasons
- Prerequisite closing plan: owner, date, dependency
- Transition plan and routing to follow-on work

No system access needed. Where a catalogue or platform exists, its counts are used as measurements if shared.

How It Is Run — One Method, Two Depths

KOMTAS

The same evidence types and phases are used in both services. The service sets how deep the evidence goes and how long each phase takes.

03 · HOW IT IS RUN

FOUR KINDS OF EVIDENCE

Measurement — B

Counts from a catalogue or platform, if shared

Document — A · B

Org chart, role assignment, domain definition, standard

Observation — B

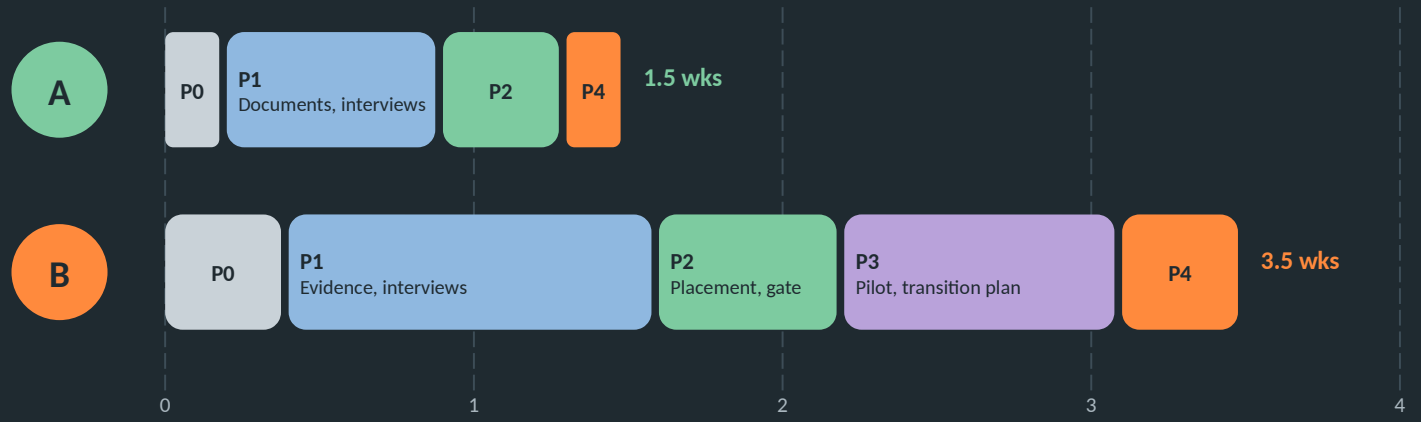

A data product traced from idea to publication

Statement — A · B

What a person says — recorded as a claim

A level or a met prerequisite is given only where a document, an observation or a measurement supports it. Statements alone are reported as claims.

PHASES BY SERVICE · M BAND, IN WEEKS

P0 scope · P1 documents and interviews · P2 gate or placement · P3 pilot and transition plan (B only) · P4 read-out

WHO DOES THE WORK

A — Assessment lead · organisation consultant · data architect

B — Lead · data architect · data product consultant · governance consultant · organisation consultant · platform and change on call

Ownership is the claim checked most often. "Our domains own their data" is tested with one question: whose name is written in which document, and what can that person decide.

Domain managers are part of the evidence. Ownership and capacity cannot be judged from the central data team alone. Interview load grows with the number of domains in scope.

What Comes Out — and Where It Leads

What each service hands over, and the follow-on work an assessment usually opens.

KOMTAS

04 · WHAT COMES OUT

WHAT IS HANDED OVER

	A	B
Prerequisite gate per domain — five items, each with its evidence	✓	✓
Indicative result per domain, marked as statement-based	✓	–
Key risks and the recommended next step	✓	–
Ten dimensions — current and target level per domain	–	✓
Domain readiness matrix with earliest start dates	–	✓
Pilot domain recommendation and its reasons	–	✓
Prerequisite closing plan — owner, date, dependency	–	✓
Transition plan and routing to follow-on work	–	✓

WHERE IT USUALLY LEADS

- **Pilot domain delivery**
  first data products in the pilot domain
- **Self-serve platform build**
  when domains cannot publish alone
- **Data product delivery**
  contract, SLA and owner per product
- **Ontology / semantic layer**
  when common definitions are weak
- **Governance programme**
  federated rules, catalogue, metadata

The report opens with a decision, not a maturity level. “Domain X can start on date Y; domain Z cannot start until … is closed.” A Readiness Check can be followed by a Readiness Assessment; evidence already collected is reused and not billed twice.

What Is Needed From Your Side — and the Next Steps

KOMTAS

Three roles on your side, two constraints that set the date, and four steps from today to the start of the work.

04 · NEXT STEPS

WHO IS NEEDED ON YOUR SIDE

Sponsor

start and read-out

Sets the decision the work supports and the service to take. Opens access to domain managers.

Domain managers

evidence · start condition

Name the boundary, the owner and the capacity they can commit; check findings for their domain.

Central data team

throughout

Explains how work runs today, what the platform offers and which work can be handed over.

HR / organisation, platform / IT and consumer representatives join in B for roles, the publishing path and consumer needs.

TWO THINGS THAT SET THE DATE

Domains in scope

Each domain adds interviews: in B, at least a manager, a data owner and a consumer.

Narrowing the domains is the main lever

Management calendars

Sponsor and domain manager interviews depend on calendars, not on team size.

Booked in P0, before interviews start

Neither can be shortened by adding people. Both are asked in the short form.

NEXT STEPS

1. **Service walkthrough** — today — you are here
2. **Service choice and short form** — about one hour
3. **Proposal** — service, band, schedule
4. **Kick-off** — domains, interviews, calendar

Start where the decision is. A Readiness Check in one to two weeks, or a Readiness Assessment in three to four when a pilot domain and a transition plan are needed.

THIS WORK · OPERATING MODEL

Lakehouse | Datawarehouse | Integration | Data Virtualization | Governance / MDM | Access Control

DATA MESH — the model that sets who runs these components, with which responsibility and under which common rules

Data mesh adds no new technology layer. It moves ownership of the same components from the centre to the domains; the assessment shows whether that move can be made.

LOGIC OF THE ASSESSMENT

Mesh is an operating model, not an architecture

What is assessed is not technology, but whether responsibility, capacity and common rules exist in the domains.

The platform is a prerequisite

Without a self-serve platform each domain builds its own infrastructure; the result is scattered silos, not a mesh.

Relation to Context 360

Interoperability across domains needs common definitions; semantic layer and master data feed this work directly.

Readiness Assessment Is Not a Platform Assessment

KOMTAS

Both use the same backbone; their questions, evidence and outputs differ

	PLATFORM ASSESSMENT	READINESS ASSESSMENT
Assessed	A system that is built and running	The prerequisites of an operating model not yet in place
Core question	At what maturity does this system run	Which domain can move to this model, and if not, why
Main evidence	Logs, configuration, platform measurements	Org chart, role definitions, decision records, interviews
Main output	Gap per dimension and an improvement roadmap	A start decision per domain and a list of prerequisites
Role of the ladder	Central — current and target level per dimension	Supporting — the gate decides whether a domain can start
Extra component	—	Prerequisite gate: not offset by high levels elsewhere
Unit of result	The platform as a whole	Each domain separately
Primary audience	Platform owner, data team lead	CDO, domain managers, organisation side

THE SUBJECT OF THIS ASSESSMENT IS THE ORGANISATION

Data mesh rarely fails because of technology. Organisations can build the platform; what they struggle with is finding the person in the domain who will take ownership of the data, and giving that person capacity. The assessment therefore mostly looks at the organisation.

THE BACKBONE DOES NOT CHANGE

Evidence model, five-level ladder, P0 – P4 process and band rule are the same in both variants.
Results stay comparable when the same organisation takes both kinds of assessment.

Seven Recurring Patterns in Data Mesh Initiatives

KOMTAS

Each can be shown with evidence; the assessment is not done to spot them but to show them

Mesh in name, central in practice

Teams are renamed “domains”, but the central data team still does the work. Only the names have changed.

Shown by: who actually builds the products published under a domain's name

Domain defined, no owner

Domain boundaries are drawn, but no domain has a named person who takes ownership of its data.

Shown by: share of domains with a named data product owner and written authority

No platform, but a mesh assumed

Each domain builds its own pipeline with its own tools. The result is lost standards and duplicated infrastructure, not federation.

Shown by: share of products published through a common self-serve platform

Data product equals table

A shared table is called a “data product”. There is no contract, SLA, version or quality commitment; consumers do not know what to rely on.

Shown by: share of products with a defined contract, SLA and owner

Federated governance read as no governance

The central standard is removed and no common rule replaces it. Each domain makes its own definitions; data no longer joins.

Shown by: number of common standards across domains and compliance with them

Responsibility handed over, capacity not

Domains are expected to own data products, but have no data engineer. Responsibility stays on paper.

Shown by: data engineering FTE per domain and current workload

Consumers not considered

Products are published, but who uses them, how they find them and what freshness to expect is not defined.

Shown by: consumers per product, discoverability and presence of an SLA

ALL SEVEN HAVE THE SAME ROOT

None is a tool or architecture problem. All seven come from responsibility being handed over while the capacity, the common rule and the consumer definition that the hand-over needs are not written down. A mesh initiative starts with writing these, not with technology.

Ten Assessment Dimensions

KOMTAS

Readiness Assessment (B). Each dimension is placed on the ladder per domain. Dimensions are not weighted and no total score is calculated.

	DIMENSION	TOPICS COVERED
D1	**Domain boundaries and ownership**	Domain definition, written boundaries, who owns the data, how overlaps are settled
D2	**Data product definition and quality**	Product contract, SLA, versioning, quality commitment, acceptance criteria, documentation
D3	**Self-serve platform capability**	The domain publishing without depending on the central team; templates, automation, environment provisioning
D4	**Federated governance**	Who sets common rules, how they are applied and how compliance is monitored
D5	**Interoperability and standards**	Common definitions, keys, schema standard, joining data across domains
D6	**Domain data engineering capacity**	People assigned per domain, skill level, current workload and continuity
D7	**Discoverability and catalogue**	Products can be found; metadata, lineage, access-request flow
D8	**Consumer experience and SLA**	Consumer definition, freshness and availability commitment, feedback and support
D9	**Central team role and transition model**	New role of the central team, hand-over plan, transition order and stop condition
D10	**Organisation, incentives and funding**	Budget model, incentive structure, career path, continuity of senior sponsorship

THREE DIMENSIONS DECIDE WHETHER A DOMAIN CAN PUBLISH AT ALL

Domain ownership, data product definition and the self-serve platform: without an owner nothing is decided, without a product definition consumers do not trust the output, and without a platform each domain builds its own infrastructure. The prerequisite gate checks these first.

Prerequisite Gate

KOMTAS

Five items, checked per domain in both services. Independent of the ladder: a prerequisite that is not met cannot be offset by high levels elsewhere.

	PREREQUISITE	WHAT IT MEANS	HOW IT IS VERIFIED	IF NOT MET
1	**Defined domain boundary**	Which data belongs to the domain and how overlaps are settled is written down	Domain definition document or decision record	The ownership debate repeats for every product; the model stalls
2	**Named data product owner**	A person in the domain who can decide scope and acceptance, with a written assignment	Assignment letter or role description	Responsibility stays on paper; the central team keeps doing the work
3	**Domain data engineering capacity**	At least one dedicated person in the domain who can build and run the product	Organisation record and current workload	The product is published but not maintained; it returns to the centre within months
4	**Publishing path on a self-serve platform**	A technical path for the domain to publish without opening a ticket with the central team	Platform document or an observed publication	Each domain builds its own infrastructure; the result is silos, not a mesh
5	**Commitment to common rules**	A written commitment by the domain to follow the federated governance standards	Standard document and domain approval	Data does not join across domains; the core promise of mesh is not met

THE GATE IS RUN FOR EACH DOMAIN

No single “ready for mesh” decision is given for the whole organisation. One domain can start today while another cannot for a year; the difference almost always comes from items two and three. Status per item: met, partly met, not met, or not assessed.

THE THIRD ITEM IS THE ONE MOST OFTEN SKIPPED

Organisations rarely struggle to draw a boundary or name an owner; what they struggle with is giving the domain a dedicated data engineer. A product handed to a domain without capacity is left unmaintained within months and returns to the central team.

Domain Readiness Matrix

KOMTAS

The main output of the Readiness Assessment (B): which domain can start when, and what is missing. The Readiness Check gives the gate columns and an indicative result.

DOMAIN	BOUNDARY	OWNER	CAPACITY	PLATFORM	RULE	RESULT	EARLIEST START

THREE RESULTS

READY TO START

All five prerequisites are met

- A pilot product and acceptance criteria can be written
- A start date can be given
- Hand-over scope and order are set

CONDITIONAL

Prerequisites can be met but are not met yet

- Each open item gets an owner and a date
- Usually waits for capacity or a platform capability
- The start date is set once the dates close

NOT READY

A prerequisite cannot be met in a foreseeable time

- The gap is usually in capacity or the platform
- The domain is deferred; data stays with the central team
- Platform work becomes a separate piece of work

NO DOMAIN MAY COME OUT READY TO START — THAT IS ALSO A RESULT

If the whole matrix is “conditional” or “not ready”, the result is that the organisation cannot move to data mesh today. The report then recommends building the prerequisites instead of the model; usually the self-serve platform first, then capacity, and organisational change last.

Five-Level Maturity Ladder

KOMTAS

Readiness Assessment (B). Each dimension is placed on this ladder per domain. A level is not claimed — it is shown with evidence; without evidence, one level lower is recorded.

LEVEL 1
Ad hoc

No rules; results depend on people

- No written standard; practices vary by team
- Problems are solved by improvisation
- No measurement; status unknown

Exit: practice is written down

LEVEL 2
Repeatable

Work is done the same way, but not written

- Experienced staff follow the same method
- A newcomer can't repeat the result
- Measurement, if any, is irregular

Exit: rule is documented and owned

LEVEL 3
Defined

Rule is written and applied

- The standard is documented and known
- Deviations are noticed
- Regular measurement, no thresholds

Exit: thresholds set, deviation measured

LEVEL 4
Managed

Measured, thresholds set, deviation visible

- Thresholds defined and monitored
- Deviation detected automatically
- Root cause analysis is done

Exit: correction is automated

LEVEL 5
Optimised

Deviation auto-corrected; continuous improvement

- Correction is largely automated
- Thresholds are updated based on data
- Improvement shown by measurement

THE LADDER IS READ PER DOMAIN

A single level for the whole organisation means little: one domain can be at level three while another is at level one.
Levels are placed per domain. The Readiness Check (A) does not use the ladder; it reports the prerequisite gate.

TARGET LEVEL IS THE ORGANISATION'S DECISION

Level three in most dimensions is enough to start a first pilot domain. Level five only makes sense where many domains publish products in production; aiming for it early adds cost without benefit.

Evidence Model

KOMTAS

Each finding is tied to an evidence type, shown in the report. The Readiness Check uses documents and statements; observation and measurement are used in B.

MEASUREMENT
Measurement

A number a system produces

· Product counts in the catalogue, platform logs, access-request times, SLA compliance records — used when shared

Highest confidence

ARTEFACT
Document

An existing document or record

· Domain definition, product contract, standard document, role assignment, org chart, decision record

High confidence · currency is verified

OBSERVATION
Observation

A process traced end to end

· A data product traced from idea to publication, an access request followed, a standard breach and how it was handled

Medium confidence · one-off observation

STATEMENT
Statement

What people report

· Interviews with domain managers and teams, central team statements, workshop outputs

Low confidence · cannot confirm a level alone

THREE-STATE EVIDENCE SCALE

Evidence provided
Level shown by measurement or document

Partial evidence
Evidence exists, but its scope is narrow or its currency unclear

Evidence could not be produced
Not measured due to missing records, or because the practice does not exist yet

THE CLAIM CHECKED MOST OFTEN IS OWNERSHIP

"Our domains own their data" is heard in almost every organisation. It is checked with one question: whose name is written in which document, and what can that person decide. If no named person can be shown, the item is marked as based on statements only.

NOT IN PLACE YET IS A FINDING

In a readiness assessment many dimensions have no practice to measure yet. That is not missing evidence; it is the finding itself: if a written plan exists but is not applied, the level follows the practice, not the plan.

Competencies and Roles

KOMTAS

Which role is active in which phase, including expected customer participation. The Readiness Check runs with the lead, the organisation consultant and the data architect; P3 is Readiness Assessment only.

ROLE	DUTIES	PARTY	ACTIVE PHASES
Assessment Lead	Method, scope, prerequisite gate and report	**Komtaş**	P0 – P4
Data Architect	Platform capability, interoperability and hand-over model	**Komtaş**	P0 – P3
Data Product Consultant	Product contract, SLA, quality criteria and the consumer side	**Komtaş**	P1 – P3
Governance Consultant	Federated governance, standards, catalogue and metadata	**Komtaş**	P1 – P3
Platform Specialist	Self-serve capabilities, automation and environment provisioning	**Komtaş**	P1 – P2
Organisation Consultant	Role design, capacity, incentives and funding model	**Komtaş**	P1 – P3
Change Management Consultant	Transition plan, adoption and training capacity	**Komtaş**	P2 – P3
Project sponsor	Decision-making, opening access to domain managers	**Customer**	P0, phase transitions
Domain Managers	Domain boundary, ownership and the decision to assign capacity	**Customer**	P0 – P2
Data Product Owners	Existing products, consumers and quality commitments	**Customer**	P1
Central Data Team	How work runs today, platform capabilities, work that can be handed over	**Customer**	P1 – P3
Platform / IT	Infrastructure, environment provisioning and the publishing path	**Customer**	P1
HR / Organisation	Role definitions, headcount and incentive structure	**Customer**	P1
Consumer Representatives	Expectations, freshness needs and problems experienced	**Customer**	P1

NO ASSESSMENT WITHOUT TALKING TO DOMAIN MANAGERS

Ownership and capacity cannot be assessed by talking only to the central data team. The central team often thinks the domains are ready; the domain manager says no headcount has been given. The value of the assessment is in showing this gap with evidence.

Duration and Sizing by Service

KOMTAS

Indicative band values. The band is set from the short form; dates are fixed at kick-off, once the domain list and interview calendar are known.

SERVICE	SMALL	MEDIUM	LARGE
A · Data Mesh Readiness Check 5 prerequisites · per domain	1 week · 3 days	1.5 weeks · 4 days	2 weeks · 5 days
B · Data Mesh Readiness Assessment 10 dimensions · ladder · gate	3 weeks · 6 days	3.5 weeks · 8 days	4 weeks · 10 days

Cell format: duration · time needed from your team (days). Your team's time grows with the number of domains. Commercial terms are set out in the proposal.

SIZING DRIVERS

DRIVER	SMALL	MEDIUM	LARGE	USED IN
Domains in scope	≤ 3	4 – 8	> 8	A · B
People to interview	≤ 12	12 – 30	> 30	A · B
Existing data products	0 – 2	3 – 15	> 15	A · B
Central data team size	≤ 5	5 – 20	> 20	A · B
Data platforms in scope	1	2 – 3	> 3	A · B
Legal entities or locations	1	2 – 3	> 3	A · B
Governance maturity	Written	Partial	None	B
Documentation maturity	Written	Partial	None	B
Access to senior management calendar	Easy	Medium	Hard	B
Previous assessment	Yes	Partial	No	B

BAND RULE · the highest band that at least three drivers fall into. One large driver alone does not set the band.

Report and Routing

KOMTAS

The report does not give a maturity grade; it gives a start decision per domain and the steps to get there

WHAT THE REPORT CONTAINS

- Domain readiness matrix and the three results
- Pilot domain recommendation and its reasons
- Open prerequisites, their owners and closing order
- Level per dimension and the evidence type behind it
- Transition plan: central team role, hand-over order, stop condition

WHAT THE REPORT DOES NOT CONTAIN

- One readiness grade or weighted score — none is calculated
- A move of the whole organisation at once
- Comparison with other organisations
- Product or platform recommendation
- Domain boundaries drawn by Komtaş — the boundary is the organisation's decision

ROUTING

- Platform capability weak — Lakehouse Assessment or platform build
- Common definitions weak — ontology and semantic layer work
- Catalogue and metadata weak — governance work
- Consumption side unclear — BI Assessment
- Routing follows from a finding; it is not a sales proposal

THE REPORT OPENS WITH A DECISION

The report does not open with “your mesh maturity is at level N”, but with “domain X can start on date Y; domain Z cannot start until … is closed”.
The whole executive summary should reduce to these two sentences.

THE MOST FREQUENT FINDING IS ORGANISATIONAL

Many assessments show that the obstacle is not on the platform or architecture side but in capacity and incentives: the domain accepts responsibility but cannot assign people. This is not a technology finding and cannot be solved with technology.

DATA PRODUCT QUALITY IS PART OF THIS WORK

Data products are assessed against contract, SLA, versioning and quality commitment in dimension D2.
Where products already exist, a sample is assessed against these criteria and findings are reported per product.

Limits of the Assessment

KOMTAS

What this work does not do and does not guarantee is stated explicitly within the report

Domain boundaries are not drawn

The boundary is the organisation's decision. The assessment checks whether it is written and consistent; it does not propose one.

No organisation design

Headcount, reporting lines and incentives are the organisation's decision. The work shows whether the current structure can carry the model.

No platform build, no product development

Self-serve platform capability is assessed; building it and developing data products are separate work.

No technology selection

The platform dimension looks at existing capability; which product to buy is not part of this assessment.

Existing platforms not assessed on their own

Lakehouse or warehouse are covered only for their ability to let domains publish; their own maturity is the subject of a Lakehouse or DWH Assessment.

No guarantee of a successful transition

The report shows which domain can start; it does not promise that the transition succeeds. That depends on capacity being assigned.

THE MOST MISUNDERSTOOD LIMIT

Organisations often expect a domain map from this work. A domain boundary is an organisational decision, not a data decision, and reflects the organisation's own division of work; a boundary drawn from outside is not accepted at the first overlap, and the model stops there.

“DO NOT MOVE TO MESH” IS ALSO A RESULT

If the whole matrix comes out “not ready”, the report says so. Where size, number of domains or capacity cannot carry the model, improving a central structure creates more value than a mesh that cannot be run.

OBJECTIONS ARE RECORDED, NOT RESOLVED

“Our domains already own their data” is a common objection; it is recorded next to the finding together with the number of named owners.
