KOMTAS

OPERATIONAL DATA GOVERNANCE ENABLEMENT

Governance at creation and at change

Discovery and design in 3–4 weeks, a pilot on one business process, then rollout in waves

1 **The problem, where it sits, the idea**
Why governance arrives late, its place in the 360 layers, and the move to creation and change. p. 2 – 4

2 **What the service delivers**
Six building blocks, and how they fit in-house, SAP and SaaS applications. p. 5 – 6

3 **Phases and measures**
Discovery, pilot and rollout; what you get and how it is measured. p. 7 – 8

4 **Next step**
Phase 0 and what is needed from you. Appendix from p. 10. p. 9

Governance Arrives After the Data Is Wrong

KOMTAS

Most governance work runs on the analytical side. By the time a check finds an error, the record has already been copied into every system downstream.

01 · THE PROBLEM

WHERE DATA IS CREATED · AND WHERE IT IS USUALLY CHECKED

Operational application
record created or changed

→

Integration
copied to other systems

→

Warehouse / lakehouse
catalogue and DQ checks run here

→

Reports and AI
errors found by users

the error is created here

...and found here, then fixed again in each copy

THREE FAMILIAR EXAMPLES

Duplicate customer or outlet records

The same customer is opened twice with different spellings. Reports, campaigns and credit limits split across both records.

A new field with no owner or definition

A field is added to an application in a release. Nobody owns it, no term defines it, and the warehouse team learns about it from a failed load.

Personal data not flagged

A field that holds personal data is created without a privacy class. Masking and access rules downstream do not know it exists.

The 1-10-100 rule of thumb. A common industry rule: preventing an error at the source costs least, correcting it later costs more, and the failure it causes downstream costs the most.

Where This Service Sits — AI Value Proposition

KOMTAS

Four layers. Each layer consumes the one below. This service works at the source of the bottom layer: the operational systems where records are created and changed.

Action 360

Intelligent Work Experience

Teams | Slack | WhatsApp | Web / Portal | Claude Desktop | API, Headless

Agent 360

Governed Digital Workforce

INDUSTRY: Manufacturing | Retail | Banking | Energy | Aviation | Other

FUNCTION: Customer Service | Sales | Finance | Procurement | Operations | Other

Context 360

Enterprise Context

Semantic Layer | Ontology | Knowledge Graph | Master Data | Corporate Memory

Data / Analytic 360

Trusted Data Foundation

THIS SERVICE · AT THE SOURCE

Datawarehouse | Lakehouse | Integration | BI & Reporting | Self-Service Analytics | Governance / MDM

Operational systems — ERP, CRM, in-house apps, SaaS · where data is created and changed

THIS SERVICE WORKS HERE

Context 360

Glossary terms and master data are defined at creation, so the context layer starts from consistent meaning.

Agent 360 / Action 360

Agents increasingly create and change records in operational systems. The same point-of-entry rules and change gate apply to them: governed creation is a precondition for governed agentic actions.

Analytic side

The warehouse receives data that has already passed the same rules.

Governance usually starts at the warehouse. This service moves it to where the record is born — and to where agents will write.

The Idea — Governance at Creation and at Change

KOMTAS

Governance moves into the operational systems and into the change process that alters them: shift left.

01 · THE IDEA

THE LIFE OF A DATA ELEMENT

Design | Build | Release | **Create record** | Integrate | Analyse

at change · the release path — at creation — where governance usually starts today

1 At creation

Checks run when a record is created or changed in the operational application.

- Quality rules called by the application before or right after the record is saved
- Personal data classified when the field exists, not after it is copied
- Matching against existing customer, outlet or product records
- One rule set, reused by the analytical side

2 At change

A data-affecting change is not done until its governance items exist.

DEFINITION OF DONE FOR A NEW FIELD OR FEATURE

- Glossary term and catalogue entry
- Named owner
- Privacy (KVKK) class
- Data quality rule
- Lineage updated

Checked as a gate in the same tools that approve the release.

From “nice to have” to “must have”. When governance is a gate on the release path, it is planned with the delivery projects that change the systems: its budget and its timing follow those projects instead of competing with them.

Six Building Blocks

KOMTAS

A menu, not a fixed bundle. Phase 0 decides which blocks apply to which system.

02 · BUILDING BLOCKS

1 Point-of-entry data quality

Rules defined once and exposed as services; applications call them when a record is created. The same rules run on the analytical side.

synchronous · asynchronous · batch remediation

2 Governance by design in the change process

A definition of done for data-affecting changes, built into ticket templates, design review and change approval.

ticket templates · design review · change approval

3 Operational metadata and lineage

Operational databases and SAP scanned; lineage from application field to glossary term, warehouse column and report.

field → term → warehouse column → report

4 Ownership and stewardship

Process owners as data owners; decision rights, an issue workflow and an escalation path.

owner · steward · escalation

5 Classification and privacy at creation

Personal data flagged when the field is created; masking and access follow from that class (KVKK).

class → masking → access

6 Master and reference data at creation

Matching and de-duplication when a customer, outlet, product or supplier record is created.

customer · outlet · product · supplier

Boundaries. Block 6 covers checks at creation; a full master data management implementation is a separate project. The service extends an existing analytical governance programme (catalogue, quality on the warehouse) rather than replacing it.

How It Fits Your Landscape

KOMTAS

How an application is built and changed decides where governance is applied. Each model has its own lever.

02 · YOUR LANDSCAPE

In-house developed
Lever: Your own SDLC

DQ AT ENTRY

The application calls the rule service directly

CHANGE GATE

Your Jira / Azure DevOps templates, design review, change advisory board

SAP with an implementation partner
Lever: The partner's change process

DQ AT ENTRY

SAP-side validation or MDG, or the rule service through middleware; coexistence set in Phase 0

CHANGE GATE

Functional specification template and transport approval

SaaS or packaged software
Lever: The vendor's change process and your integration layer

DQ AT ENTRY

Validation in the integration layer (API gateway or iPaaS)

CHANGE GATE

Vendor release review and configuration change control

PHASE 0 OUTPUT · SYSTEM × BUILDING BLOCK MATRIX

illustrative

System	1	2	3	4	5	6
Customer onboarding app in-house	●	●	●	●	●	●
ERP SAP + partner	○	●	●	●	–	○
CRM SaaS	●	●	●	●	●	–

● applies ○ applies, coexists with an existing SAP function

The core Phase 0 question

For each application that creates critical data: who builds it, who changes it, and through which process a change is approved. The answer decides which building block is applied through which lever.

Three Phases — Design, Prove, Roll Out

KOMTAS

A fixed-price discovery first; a pilot on one business process; then rollout in waves.

03 · PHASES

0 Discovery and Design

Fixed price · 3–4 weeks

- Application inventory and development model
- Critical data elements: where, by whom, through which process they are created
- Change process map: SDLC, CAB, SAP transports, vendor releases
- Current tooling and licences
- System × building block matrix
- Target operating model draft
- Pilot selection, success criteria, KPI baseline
- Roadmap and price for pilot and rollout

1 Pilot

6–8 weeks · one process, one system

- Point-of-entry quality live for the pilot data elements
- Change gate applied in one real release
- Glossary and catalogue entries
- Lineage from application to warehouse and report
- Steward workflow running
- KPIs measured before and after

Example pilots: customer or outlet onboarding; product or material creation.

2 Rollout

In waves · by process or system

- Waves planned from the matrix
- Priced per wave, or time and materials with a cap
- Rules and metadata handed over to your teams
- Optional managed service for rule and metadata operations

Each wave repeats the pilot pattern on the next process or system.

Why start with discovery?

Which blocks apply, and through which lever, depends on how each application is built and changed. Phase 0 measures that first, so the pilot and the rollout are priced against a known landscape.

What You Get and How It Is Measured

KOMTAS

Every deliverable stays with your teams. Progress is measured against a baseline set in Phase 0.

03 · OUTCOMES

WHAT YOU GET

- **One rule set** quality rules shared by applications and analytics
- **A working change gate** definition of done inside your change tools
- **Governed critical data** glossary, catalogue entries and lineage to the report
- **Named owners and stewards** decision rights, issue workflow, escalation
- **Privacy from the start** personal data classified when the field is created
- **A roadmap** waves, priorities and prices for the rest of the landscape

HOW IT IS MEASURED

- **Coverage of critical data elements**
  share with an owner, a glossary term and a DQ rule
- **Error rate at entry**
  for the pilot data elements, before and after
- **Changes through the gate**
  share of data-affecting changes that passed it
- **Time to add a governed field**
  from request to a released, documented field
- **Issues traced to source**
  downstream data issues traced back to their origin

Baseline first. The KPI baseline and the pilot's success criteria are agreed in Phase 0, so the pilot result is a measured difference rather than an opinion.

Next Step — Phase 0, and What Is Needed From You

KOMTAS

Four inputs make the discovery possible. Most of them already exist in your teams; Phase 0 collects them in one place.

04 · NEXT STEP

WHAT IS NEEDED FROM YOU

Application landscape

The applications that create customer, product, supplier or similar records; who builds and maintains each one.

week 1

Change process contacts

Owners of the SDLC and change approval; the SAP implementation partner and key vendors where they apply.

week 1

Tooling and licences

Which governance, catalogue and data quality products are licensed today, and which editions.

week 1

Business owners for a pilot

One or two candidate processes, such as customer onboarding, and the people who own them.

workshops

NEXT STEPS

1. **Walkthrough** — today — you are here
2. **Scoping call** — candidate processes and systems
3. **Phase 0 proposal** — fixed price, 3–4 weeks
4. **Kick-off** — inventory, change process, critical data

Start with one process. Phase 0 maps the landscape and picks the pilot; the matrix, the operating model draft and the roadmap stay with you whichever way the rollout is run.

APPENDIX

Detail — for reference and questions

A	**Change gate and point-of-entry quality** Definition of done and release path · Three patterns, one rule set	p. 11 – 12
B	**Technology options** Informatica, Talend, OpenMetadata, SAP coexistence	p. 13
C	**Roles and scope** Roles and decision rights · Scope and adjacent services	p. 14 – 15

The Change Gate in Detail

KOMTAS

What a data-affecting change must carry before release, and where the check sits for each development model.

DEFINITION OF DONE · DATA-AFFECTING CHANGE

ITEM	WHAT IS REQUIRED	PROVIDED BY
Glossary term	Business definition of the new field, linked to an existing or new term	Analyst, data steward
Catalogue entry	Field registered with source system, type and description	Developer, scanner
Owner	Named data owner, usually the process owner	Business
Privacy class	Personal or sensitive data flagged (KVKK); masking and access follow	Data steward, privacy
DQ rule	At least one rule from the shared rule set, or a new one	DQ engineer, steward
Lineage	Application field linked to warehouse column and report	Scanner, developer

WHERE THE GATE SITS

In-house
Ticket template in Jira or Azure DevOps; design review; change advisory board

SAP + partner
Functional specification template; transport approval

SaaS / packaged
Vendor release review; configuration change control

The data steward has a seat in the change process and signs off the governance items.

THE RELEASE PATH

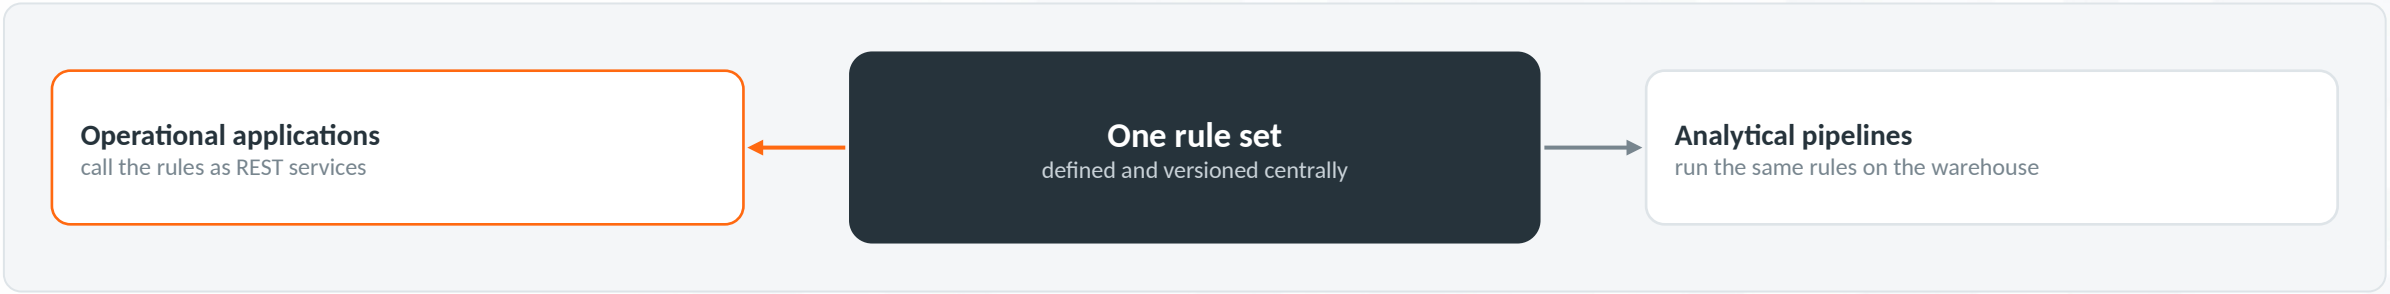

Request → **Design review** → Build → Test → **Change approval** → Release

Two checkpoints: governance items are named at design review and confirmed at change approval. A change that misses them goes back, as a failed test would.

Point-of-Entry Data Quality — Three Patterns, One Rule Set

KOMTAS

Rules are defined once and published as services. Each application uses the pattern that fits how it creates data.

A Synchronous

In the screen or API call, before the record is saved.

When	Data entered by people or partner APIs; immediate feedback matters
How	Application calls the rule service; the user corrects on the spot
Watch	Response time and availability of the service

B Asynchronous

Right after the write, from an event or change data capture.

When	High-volume or packaged systems that cannot wait for a call
How	Event or CDC triggers the rules; issues routed to a steward
Watch	The bad record exists for a short time; workflow must close it

C Batch remediation

For records that already exist.

When	Before or alongside A and B, to clean the current stock
How	Same rules run in bulk; issues grouped by owner
Watch	Volume of findings; agree priorities with data owners

Most landscapes use more than one pattern. Phase 0 sets the pattern per system in the system × building block matrix.

Technology Options

KOMTAS

The method is vendor-neutral. These are the options most often in place; Phase 0 works with what is already licensed.

OPTION	COVERS	NOTES
Informatica IDMC	Glossary, catalogue and lineage (Cloud Data Governance and Catalog); data quality (Cloud Data Quality); master data (MDM SaaS)	Data quality rule specifications can be enabled for API use and published as REST endpoints, so applications call the same rules used in analytics. Komtaş is an Informatica partner.
Qlik Talend Cloud	Data quality and stewardship; data catalogue	Part of the Komtaş product line. Rule exposure to applications is designed in Phase 0 per edition.
OpenMetadata	Glossary, catalogue, lineage (including OpenLineage ingestion), data contracts, SQL-based data quality tests	Open source. It is not a point-of-entry runtime engine: when it is chosen, block 1 needs a separate rule service.
SAP MDG and application validations	Validation and master data checks inside SAP	May already cover parts of blocks 1 and 6. Phase 0 decides how they coexist with a central rule set.

Product capabilities change. Phase 0 confirms current support for your exact products and editions before the pilot design is fixed.

Roles and Decision Rights

KOMTAŞ

Who does what on your side, and who Komtaş brings. In operational data the data owner is usually the process owner.

YOUR SIDE

ROLE	RESPONSIBILITY
Data owner	Usually the process owner; decides definitions and quality thresholds
Data steward	Runs the issue workflow; signs off governance items at change
Application owner	Builds the gate into the team's change process
SAP partner / vendors	Apply the gate in specifications, transports and releases
Change advisory board	Checks the definition of done before release
Privacy officer	Owns the privacy classes (KVKK)

DECISION RIGHTS · STARTING POINT, SET IN PHASE 0

DECISION	DECIDES · CONSULTED
Term definition, DQ threshold	Data owner · steward, analytics team
Privacy class of a field	Privacy officer · data owner, steward
Release of a data-affecting change	Change advisory board · data steward

KOMTAŞ TEAM

- **Governance lead / architect** method, operating model, design
- **Data quality engineer** rules and their exposure as services
- **Integration developer** application and middleware calls (pilot)
- **Business analyst / process consultant** processes, critical data elements
- **Project manager** part time

ESCALATION

Steward → **Data owner** → **Governance council**

Team size follows the matrix. The integration developer joins for the pilot and the rollout waves that need application or middleware work; the other roles run through all phases.

Scope and Adjacent Services

KOMTAS

What the service covers, and the related work that is offered separately.

IN SCOPE

- The six building blocks, as selected in Phase 0
- Rule design and exposure of rules as services
- Change gate templates and process changes
- Glossary, catalogue and lineage for the agreed critical data
- Ownership model, steward workflow, escalation
- KPI baseline and measurement; handover to your teams

OUT OF SCOPE · ADJACENT

- Full master data management implementation (unless part of a pilot)
- Building new applications
- Report governance — separate service
- AI governance — separate service
- Analytical-side catalogue programme — this service extends it
- Licence costs of governance and quality products

The boundary with master data management

Block 6 applies matching and de-duplication when a record is created. Where a master data hub is needed — golden records, survivorship, distribution to all systems — it is scoped as its own project. Phase 0 writes the boundary down for each master data domain.
